

Solar Panels Over Green Roof Notes:

The structures over the green roof are not to be more than 6.5 feet wide.

Panels must have a minimum - 3 foot separation between each array.

The lower edge of the solar panel must be at least 1 foot above the top of the green roof and the upper edge must be at least 2.5 feet above the top of the green roof. For flatter installations, the lower edge would need to be raised to ensure that the 2.5 foot minimum for the upper edge is met.

Refer to diagram above.

Refer to green roof technical details for green roof components.
